

# Searches for exotic long-lived particles at LHCb

Pieter David

Nikhef Jamboree 2014

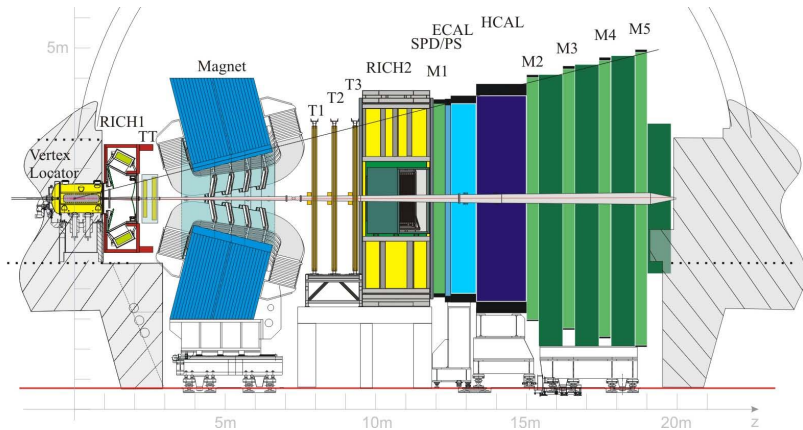

# New Physics and long-lived particles

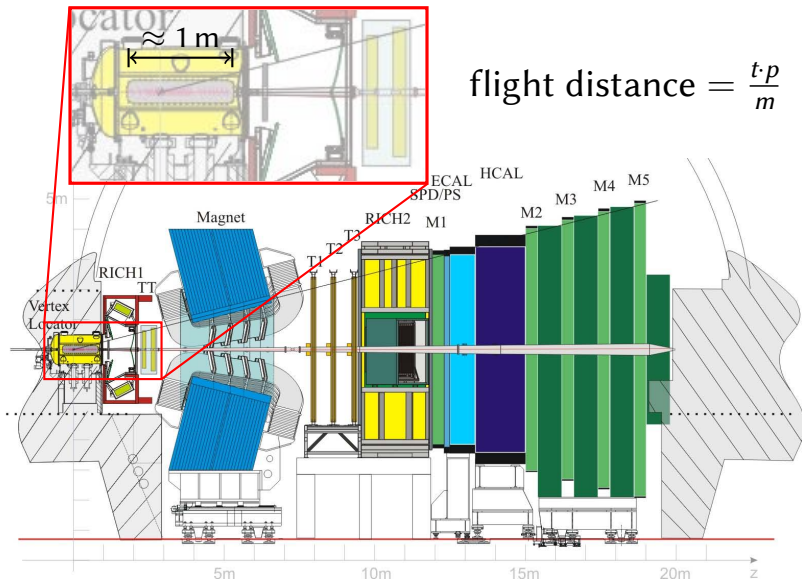

In BSM theories:

- $R$ -parity violating LSP decays
- suppressed NLSP decays
- decays of exotic hidden sector particles into SM particles
- ...

## Simulated signal

$$m_{\pi\nu} = 35 \text{ GeV}/c^2, \tau_{\pi\nu} = 10 \text{ ps}$$

Final selection

## Simulated signal

$$m_{\pi_V} = 35 \text{ GeV}/c^2, \tau_{\pi_V} = 10 \text{ ps}$$

## Data

$$\sqrt{s} = 7 \text{ TeV}, \mathcal{L} = 0.62 \text{ fb}^{-1}$$

Final selection

# Signal+background fit to data

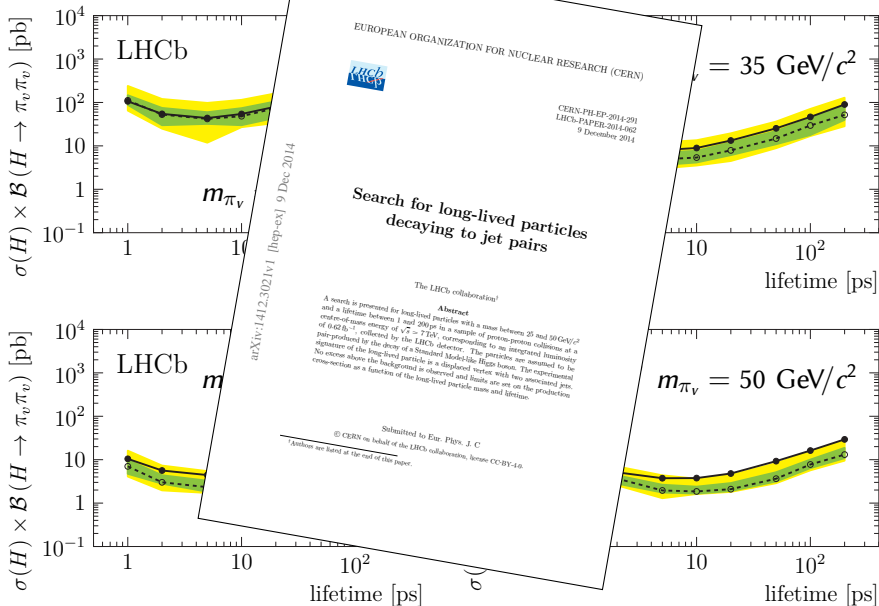

$R_{xy}$  intervals aligned  
with trigger and  
preselection categories

Simultaneous fit with  
RooFit and limit with  
RooStats

# Another final state: $X \rightarrow \mu^+ \mu^-$

Search in the range  $m \gtrsim 7.5 \text{ GeV}/c^2$ ,  
 $c\tau \lesssim 100 \text{ mm}$

Advantages of LHCb:

- Good muon identification
- Excellent mass and vertex resolution
- Efficient inclusive trigger
- Large  $\Upsilon(1S)$  and  $Z^0$  control samples

$\Rightarrow$  high efficiency and little background, even for small lifetimes
